

Adding Categories to Extract Sets

Although LYNX has several [LYNX Settings - Events](#) for adding categories and custom attributes to imported events based on SIS data, you can also add categories in a targeted fashion to specific extract sets.

To choose which categories are added to an extract set:

1. Select the Extract Set From the List

The existing [extract set](#) may be under any of the following types:

- Section Import
- Exam Import/Export
- Exam Creation

2. Click the Settings Button Below the List

3. Add Your Categories

Type one or more categories from 25Live into the **Associated 25Live Event Categories** field.

Once this is configured, LYNX will begin adding categories to all sections or exams imported through that extract set. You may want to trigger a [manual update](#) to ensure all events are updated right away.

[Home](#) / [Import to 25Live - Section Import](#) / [Settings](#)
