

Adding Categories to Extract Sets

Although LYNX has several [LYNX Settings - Events](#) for adding categories and custom attributes to imported events based on SIS data, you can also add categories in a targeted fashion to specific extract sets.

To choose which categories are added to an extract set:

1. Select the **extract set** from the list. It can be any of the following types:
 - Section Import
 - Exam Import/Export
 - Exam Creation
2. Click the **Settings** button below the list.
3. Type one or more categories from 25Live into the **Associated 25Live Event Categories** field.

Once this is configured, LYNX will begin adding categories to all sections or exams imported through that extract set. You may want to trigger a [manual update](#) to ensure all events are updated right away.
