

# Functional Security Report returns incomplete results

Last Modified on 11/08/2023 3:23 pm PST

## Symptom

When I run the functional security report I am getting back incomplete results. There is no error returned but not all the information that I am expecting to be in the report is present.

## Resolution

25Live is distributed with default security settings for each of the category and security group. The database table used by the report only stores those values that have been modified and saved through 25Live. Essentially the report is only printing what is stored in the database.

### **Solutions:**

- Use WebServices reports.
  - You can modify all the security group settings manually and save them.
-
