

## 12/05/2024 – Series25 Group Administration

- A "Shift + click" keyboard-mouse shortcut now works across various pages to make selecting multiple rows in a table more efficient
- Fixed loading issue if selecting an empty list (such as Event Form Presentation, Location Security, etc.) when [configuring a security group](#)
- Using an ampersand (&) in a username no longer causes issues when saving modifications for the user such as [password](#) or security group changes
- Resolved issue when going back after configuring group members. If you're asked to discard changes but cancel, you're now properly returned to the original page you were working on
- Addressed loading problem when searching for a report in [Report Security](#) for a report name that doesn't exist
