# Fall 2025 - Series25 LYNX Interface

- Translation rules are now paginated in the LYNX UI
- Workday
    - Resolved data loss on export, which includes a new configuration setting to control how LYNX handles section and exam exports to Workday when meeting pattern or location data differs between the two systems
    - Increased the maximum number of terms that can be designated for auto-initialization from 3 to 12
    - The exam API is now enabled for all Workday customers (this had previously been disabled for some due to permissions)
    - Workday sessions now sync based on change detection more efficiently  with updated steps, minimizing the need for initialization on certain associated course section data
- Ethos: The SIS Custom Attribute for section credit hours is now populating
- Anthology: Development supporting the Anthology-driven switch from API key authentication (which will be removed at the end of the year) to Application Key authentication is complete
- Events.csv now supports files with UTF-8 BOM encoding
- When LYNX encounters an orphaned reference in a data translation rule (i.e., a reference that does not correlate to an object in the SIS), it will now check for anything that has the same name
- Added a new button to "Delete All" translation rules — useful if your institution needs to remove a large number of rules and/or if the names of a large number of objects are changed in the SIS
- *12/04/2025* - Resolved issue with waiting import processes showing lock errors
- *12/11/2025*  - Provided a method for Workday users to choose export meeting pattern changes to the SIS using an option to access meeting pattern edits in the 25Live Meeting Pattern Grids, as well as in the export extract set settings without needing to contact CollegeNET to turn on a setting
