

07/16/2026 – Series25 LYNX Interface

- A new option in [LYNX General Settings](#) lets administrators configure email notifications for section export messages, matching the existing option for section import messages
 - The [Shared Locations](#) configuration now supports adding multiple locations at once and includes an expand option to show the full list when many locations are configured
 - Added a link between [Import Process](#) detail pages and History Process detail pages, making it easier to trace what triggered an import
 - Users can filter [import and export messages](#) by message type directly from the message summary, with a persistent filter indicator helping users find and review messages related to the most critical warnings and errors more easily
 - A temporary downtime alert banner displays for all users during sprint release windows
 - Resolved long-term initialization times for [Ethos](#) instances caused by the course data request pulling unrestricted data; the call is now limited to the relevant term
 - Fixed an issue where the [Workday](#) API returned an error when a Student Transaction Log Outbound Connector contained multi-institution data, preventing change detection for affected schools
 - Addressed incorrect headcount values sent to 25Live for meeting patterns not included in a bound group when sections have multiple meeting patterns with a subset that is bound
 - Resolved a UI hang and missing message that occurred when using LYNX to invoke Academic Priority by sending an event to 25Live
 - Fixed an issue where [API integration](#) data containing the string "null" was stored as the literal text instead of being treated as a null value
 - Ensured the search in [LYNX - Cleaning Up 25Live](#) > "Sections Outside of Extract Sets" completes reliably and returns accurate results
 - Resolved a [system error](#) that failed silently when loading worker data containing a null last name value, so users now see an informative error message instead of a generic sync disabled status
 - *07/20/2026 Patch:*
 - Fixed an issue where location features and room characteristics defined in the SIS were not being imported into 25Live for Ethos environments
-
