

08/06/2026 – 25Live

- Schedulers can now choose which [segments](#) to include when copying a segmented event, and set a new start date and occurrence mapping for each selected segment individually. (Previously, copying a segmented event carried over all segments at once.)
- When copying an event that includes related events, schedulers can now update the start date of each related event using the new Mapping Start Date column in the copy modal.
- Chat channels for events have been converted from public channels and direct messages to private channels, no longer allowing anyone browsing to open the channel list.
- Administrators who have defined a custom sort order for custom attributes will now see that order reflected consistently in the Event Form rule editor.

Accessibility Improvements:

- The More menu now closes when focus moves past its last item, announces its expanded and collapsed state, and no longer allows About modal options to be skipped.
- Administrators will now see a "Saved!" confirmation when toggling checkboxes in Master Definitions.
- The Close and Apply buttons in the Manage Occurrences panel are now clearly distinguished for screen reader users, and the Add Occurrence action and Comment/State fields have been properly labeled.
- The Start Time, End Time, and Locations fields in Express Scheduling now have accessible labels for screen reader users.
- Search dropdowns are now keyboard focusable.
- Switching between search views no longer resets focus to the top of the page and view changes are announced to screen readers.
- The search field now has an accessible label.
- Selected day elements on calendars now announce their state to screen readers.
- Location and resource hover content is keyboard accessible.
- The Availability grid now has correctly associated table headers and ARIA roles.
- Toggling a checkbox in Master Definitions now shows a confirmation instead of saving silently.
- The Find Available Locations dashboard form now includes accessible instructions for screen reader users.
- Heading levels are now consistent throughout 25Live.
- Custom attribute fields, event occurrence tooltips, and System Settings tabs have structural and labeling fixes.
- Several keyboard and screen reader updates have been made to the Event Form: Validation errors now announce in context, status messages are read aloud automatically, custom dropdowns are fully keyboard accessible, Yes/No toggles behave as proper radio buttons for assistive technology, and several button and table labeling issues have been resolved.
- The Skip to Content link now works correctly for keyboard users with a screen reader active.
