

09/10/2026 – 25Live LYNX Interface

- Workday integrations can now authenticate using [OAuth](#); username and password sign-in is still available as a fallback for Workday customers who haven't configured OAuth
- A new ["SIS Health"](#) connectivity test lets administrators check whether LYNX can reach each configured SIS endpoint, with clear success or failure messages (only available for Ethos and Workday, with more SIS coming soon)
 - "SIS Health" also verifies SIS permissions, reporting which are granted, denied, or misconfigured
- System settings changes are tracked with a new "History" option showing who changed each preference, when, and the previous value
- Administrators can export configuration settings from one LYNX environment and import them into another using the new "Export Config" and "Import Config" options under *Configuration > Settings*
 - Importing a production configuration into a test environment automatically sets "Academic Priority" to "No" to prevent test imports from triggering real Academic Priority emails
- Fixed ["Profile does not exist" errors](#) that appeared for exam headcount updates on existing, already-imported courses
- Resolved a performance issue in LYNX for Ethos that caused [term initializations](#) to take longer than expected
- Addressed an issue where "Conversion" or "Make-up" profiles could incorrectly be marked as the primary profile in a bound set
- Ensured the ["Shared Locations"](#) list on the location settings page sorts alphabetically
- *Patch 09/14/2027*
 - Fixed an issue where the "Apply configuration" button in Import Config did not activate when confirming a production instance name, preventing the settings import from completing
 - Resolved an error that occurred when applying an imported configuration to a prod-test instance instead of completing the import
- *Patch 09/22/2027*
 - Fixed an issue where active sections synced through an Ethos Banner integration could be incorrectly canceled in 25Live with no indication why
