

09/17/2026 – 25Live

- *Event Quota improvements:*
 - Event Quotas can be applied per week, in addition to per day, month, and year.
 - **This improvement is due to your request on Feature Upvote. Learn how to [join the discussion](#).**
 - Event Quotas can include active space requests toward the quota limit, not just confirmed reservations. ([Requested on Feature Upvote](#))
 - Event Quotas can be scoped to specific event types, so a quota can restrict one type of booking without affecting others. ([Requested on Feature Upvote](#))
- Users can add a new [occurrence](#) to an event directly, choosing the date and adding locations or resources up front, without copying an existing occurrence and cleaning it up first
- The [Rate Schedule](#) settings include a new "Internal Notes" field for recording notes that aren't shown to requestors. ([Requested on Feature Upvote](#))
- Academic event searches support new comparative criteria between registered headcount, expected headcount, and capacity (for example, RHC > CAP, or an RHC:EHC ratio), making it easier to find under-enrolled or oversized sections. ([Requested on Feature Upvote](#))
- Deleting a paused LYNX-imported section in 25Live automatically un-pauses it in LYNX so it can be re-imported
- *Additional Fixes and Improvements*
 - Users see a new warning when adding or removing a location on a [bound event](#), since the change applies to all occurrences of both bound events
 - 25Live and Connect25 support a new dedicated password reset flow, and passwords can include a wider range of characters (letters, digits, spaces, and common symbols, 5 to 128 characters)
 - Fixed a conflict check in the Event Form that skipped bound events other than the one being edited, which could prevent a location from being assigned to the bound event
 - Resolved an issue where searching for [blackouts](#) in a specific location also returned blackouts in other locations
 - Addressed an issue where deleting the first occurrence of a repeating event could unexpectedly change the event's profile end date
 - Ensured document variables transform correctly when the same document appears more than once in the event's "Email Event" list
 - Corrected a setup/takedown conflict alert that could appear for multi-occurrence events even when the conflicting event didn't actually overlap
 - Made sure the [event form](#) honors event form security settings when checking for setup/takedown conflicts
 - Fixed the Task search default/system search options to ensure "Export Results" is available
 - Ensured saving an event with multiple event form tabs open correctly opens the new event's details and shows a save confirmation
 - Addressed an Availability view issue where copying an occurrence to a new date didn't reflect the new date in Occurrence Details until the page was refreshed

- Fixed the screen reader announcement for the "Chat" link so unread messages are announced more clearly
- Updated the SAML SSO authentication context comparison from "exact" to "minimum" to support a broader range of compliant authentication methods
- Corrected an issue where saved layout capacities didn't stick when multiple layouts were selected for a location with Edit Mode on
- Fixed an issue where an event form date exception on the initial date could make all locations appear unavailable, even after a new date was selected
- Resolved an unlabeled option in the [advanced search](#) custom attribute operator dropdown
- Addressed an issue where creating a contact from the event form's "Additional Details" option could fail to save
- Prevented the location's default scheduler contact role from appearing blank on the event form for certain locations
- Fixed a date/time custom attribute field on the event form that didn't let users select a time
- Corrected an issue where [copying a contact](#) and entering a new email address for the copy would discard the new address and keep the original contact's email
