

10/15/2026 – X25 Analytics

- The Schedule25 Optimizer now supports Academic Priority. Administrators in the (-1) security group whose LYNX instance has Academic Priority configured see an "Academic Priority" checkbox in the [Run Create/Edit modal](#)
- *SIS Custom Attributes improvements*
 - SIS Custom Attributes present on the data used to build a snapshot appear in new columns on the [Events tables](#) and in the Events Excel export, giving users additional information about their underlying section data
 - Users can filter on Attributes in the Events section of a snapshot's [data filter](#) when the attributes are present on the data used to build the snapshot
 - Each SIS Custom Attribute in a data filter offers a "(No value)" choice that includes events without a usable value for that attribute
 - The Events tables and Events Excel export show SIS Custom Attribute values that were never set as empty, separate from true blanks and zeros, for newly captured snapshots
 - Administrators can hide table columns for all users from the new "Column Preferences" page under "Projects" > [Settings](#)
- Users can sort the [Embedding](#) configuration table by "Name", "Target ID", "Content Type", "Last Modified", or "User"
- *Additional Fixes and Improvements*
 - When users uncheck columns in the column selection drop-down on a table, those columns are hidden for that user, and X25 Analytics now remembers the selection the next time they visit the table
 - The list of Optimizer runs on the "Select" page is a scrollable table, keeping the navigation menu, including the "Optimize" option, easy to reach
 - The Embedding page's configuration table scrolls, keeping the left-hand navigation menu easy to reach when the list grows long
 - The [Traffic Map report](#) leaves non-overlapping bound segments, such as makeups, conversions, and back-to-back sections, out of summed headcounts when "Sum Bound Head Counts" is selected in the data filter
 - Fixed an issue where a non-overlapping bound event with a secondary binding rank did not appear in the Traffic Map report
 - Amended the spelling of "Unique Partitions" on the "Report Summary" worksheet in the Locations table Excel export
 - Addressed an unexpected security message that appeared when using X25 Analytics as a user in the (-1) security group
 - Resolved an issue where the "Snapshots" table did not show the selected project's snapshots, including the new snapshot, after creating a [Quick Snapshot](#)
- *Accessibility Improvements*
 - Keyboard navigation stays within modals that control significant functionality, so keyboard and screen reader users do not move through inactive content behind them

- The "Help" button in the header matches the configured system theme, supporting accessible color contrast
 - *10/16/2026 Patch:*
 - Fixed the "Sort Locations by Relevance" button not working after events are filtered in the Academic Grid
 - Resolved the Academic Grid losing the shading that separates filtered events from other events after a location assignment changes
-
